Introduction

About the Down Syndrome Association of West Michigan (DSAWM)

The DSAWM is a 501(c)(3) nonprofit organization that is committed to spreading awareness and educating its membership and the general public about all issues associated with Down syndrome. We are an affiliate of the National Down Syndrome Society and National Down Syndrome Congress.

The mission of the Down Syndrome Association of West Michigan is to be a resource and advocacy organization promoting public awareness and supporting lifelong opportunities for individuals with Down syndrome and their families.

DSAWM PRIORITY AREAS

Programming and Social Events

The DSAWM develops therapeutic, social and recreational programs and services that enrich the lives of individuals with Down syndrome and their families, including the following:

- ✓ For Newborns, Infants and Toddlers with Down Syndrome and Their Families
 - Home Visit Program
 - Signing Time Program
- ✓ For School-Age Children with Down Syndrome and Their Families
 - iCan Bike Camp
 - Tween Scene
 - Adaptive Water Ski Clinic
- ✓ For Teenagers and Young Adults with Down Syndrome
 - THREADS Social Activities
 - Cooking Capers
 - Shape Up! Fitness Class
- ✓ For Parents and/or Caregivers of Children with Down Syndrome
 - Dads Appreciating Down Syndrome (D.A.D.S.)
 - Moms' Night Out
 - Community Groups
- ✓ Social Events
 - Spring Member Event
 - Summer Picnic
 - Holiday Party

Education

The DSAWM works to ensure that individuals with Down syndrome receive a quality education that will help prepare them for further education, employment and/or independent living, by providing parents/caregivers and educators with information, resources and support, including the following:

- | | |
|--------------------------------|------------------------------|
| ✓ DSAWM Lending Library | ✓ Annual Educator Conference |
| ✓ DSA Press Monthly Newsletter | ✓ Workshops and Conferences |
| ✓ Teacher Information Packet | |

Family Support

The DSAWM provides social, emotional and financial support to caregivers of individuals with Down syndrome, by way of the following:

- ✓ Parents for Parents Mentoring Program
- ✓ Parent-to-Parent Network
- ✓ Guide for New & Expectant Parents
- ✓ Guide for Parents of Teens and Young Adults with Down Syndrome
- ✓ Hospital Meal Voucher Assistance Program
- ✓ Member Assistance Funds
 - Financial Assistance
 - Adoption Assistance
 - Respite Assistance

Awareness

The DSAWM works to increase public awareness, acceptance and understanding of the abilities of individuals with Down syndrome through the following:

- ✓ Step UP for Down Syndrome Awareness Walk
- ✓ Bi-Annual Book Distribution
 - Professional Books to School Districts and Universities
 - Children's Books to Area Public and School Libraries
- ✓ Presentations to Classrooms, Community Groups, etc.
- ✓ Promoting Possibilities Medical Outreach Program

For more information on the Down Syndrome Association of West Michigan, please visit our website at www.dsawm.org.

About Down Syndrome

IS IT “DOWN’S” OR “DOWN” SYNDROME?

Down syndrome is named after Dr. John Langdon Down, an English physician who first described the characteristic features of Trisomy 21 in 1866. People now use the term “Down syndrome” as opposed to “Down’s syndrome” because Dr. Down did not have Down syndrome, nor did he own Down syndrome.

WHAT IS DOWN SYNDROME?

Down syndrome is primarily caused by an error in cell division called nondisjunction, which causes a person’s cells to have forty-seven, instead of forty-six, chromosomes. In Down syndrome, there are three – not two – copies of the number 21 chromosome, resulting in the medical diagnosis of Trisomy 21. This extra genetic material causes changes in the orderly development of the body and brain, as well as the physical characteristics and delayed physical, intellectual and language development associated with Down syndrome. The cause of nondisjunction is currently unknown.

MORE ALIKE THAN DIFFERENT

People with Down syndrome are more like their typically developing peers than they are different. There is great diversity within the population in terms of personality, intelligence, appearance, humor, learning styles, compassion, compliance and attitude. Although persons with Down syndrome may share traits and similarities in appearance, they look more like their family members than they do one another. They have a full range of emotions and attitudes, are creative and imaginative in play, and grow up to live independent lives with varying degrees of support and accommodations. Individuals with Down syndrome establish friendships, pursue interests and are included in community activities.

Children with Down syndrome benefit from the same care, attention, and inclusion in community life that help every student to grow. As with all children, quality education in neighborhood schools, preschools, and at home provides important opportunities for developing strong academic and social skills.

FACTS ABOUT DOWN SYNDROME

- ✓ Down syndrome is the most common chromosomal abnormality in humans.
- ✓ Down syndrome occurs in every 600-800 live births and is not related to race, nationality, religion or socioeconomic status.
- ✓ While the age of the mother can be a factor in whether or not a child will have Down syndrome, eighty percent of people with Down syndrome are born to parents under the age of thirty-five.
- ✓ Down syndrome occurs in males and females evenly.
- ✓ Nothing that a parent did or did not do during a pregnancy causes a baby to have Down syndrome.

THE FUTURE FOR CHILDREN WITH DOWN SYNDROME

Individuals with Down syndrome have more opportunities than ever before. As young people with Down syndrome show what they can accomplish with the support of their families, friends and communities, and as they are integrated into mainstream programs, more and more doors open for others.

We have seen a TV series starring a talented actor with Down syndrome. Two young men have authored a book, *Count Us in: Growing up with Down Syndrome*, and have impressed audiences around the country at book signings and on talk shows. *Honor Thy Son*, a fast paced mystery by Lou Shaw, features two characters with Down syndrome who are faithfully portrayed as multidimensional young adults. A young man with Down syndrome was the winner of the 1996 Best Actor honor at the Cannes Film Festival.

Along with these shining examples, thousands of people with Down syndrome across the world are quietly going about their lives without fame or fanfare. They transform their communities just by being there. They have dreams and the determination to reach their goals. They learn in regular classrooms in their neighborhood schools with the children who will one day be their coworkers, neighbors and adult friends. Young adults hold diverse and meaningful jobs, maintain their own households and make significant contributions to their communities every day.

Myths and Truths about Down Syndrome

For individuals with Down syndrome, success as adults in the community and workplace requires the opportunity to continue to grow and learn in the classroom along with those who will later be their coworkers and neighbors. Thus, it is important to dispel the myths associated with Down syndrome and recognize that the social, emotional and educational needs of children who have Down syndrome are mostly the same as those of other children.

MYTH: PEOPLE WITH DOWN SYNDROME HAVE SEVERE MENTAL RETARDATION

Standard IQ tests score students with Down syndrome in the mild to moderate range of cognitive impairment; however, these tests do not measure many important areas of intelligence, and you will often be surprised by their memory, insight, creativity and cleverness. The high rates of learning disabilities in students with Down syndrome often mask an array of abilities and talents. Educators and researchers are still discovering the full potential of people with Down syndrome.

See www.craigblackburn.org for a shining example of a young adult with Down syndrome who graduated high school with a regular diploma and now travels around the country as a self advocate. Jason Kingsley, one of the authors of *Count Us In*, also graduated with a regular diploma and passed all his New York State Regents Competency exams.

MYTH: ADULTS WITH DOWN SYNDROME ARE UNEMPLOYABLE

Businesses are seeking young adults with Down syndrome for a variety of positions. They are employed in small- and medium-sized offices, by banks, corporations, nursing homes, hotels and restaurants. They work in the music and entertainment industries, in clerical positions, and in the computer industry. People with Down syndrome bring to their jobs enthusiasm, reliability and dedication.

MYTH: PEOPLE WITH DOWN SYNDROME ARE ALWAYS HAPPY

People with Down syndrome have feelings just like everyone else in the population. They respond to positive expressions of friendship and are hurt and upset by inconsiderate behavior.

MYTH: ADULTS WITH DOWN SYNDROME ARE UNABLE TO FORM CLOSE RELATIONSHIPS LEADING TO MARRIAGE

People with Down syndrome date, socialize and form ongoing relationships. Some are beginning to marry. In fact, the Best Documentary winner at the 2010 Tribeca Film Festival was *Monica and David*, a film exploring the marriage of two adults with Down syndrome.

MYTH: INDIVIDUALS WITH DOWN SYNDROME ARE STUBBORN

A student with Down syndrome may not be able to tell you how she feels. This can lead to the false perception that she is “stubborn.” Behavior is communication. Consider all of the circumstances. Is your student experiencing sensory or communication difficulties?

MYTH: BEHAVIOR PROBLEMS AND DEPRESSION ARE JUST PART OF HAVING DOWN SYNDROME

Often, medical or mental health problems go untreated due to the assumption that it is typical of this genetic condition. Complete examinations by appropriate health care professionals should always be pursued.

MYTH: CHILDREN WITH DOWN SYNDROME “PLATEAU”

Learning is a lifelong experience for people with Down syndrome, as it is for everyone. Individuals with Down syndrome learn at a slower pace, but nonetheless continue to learn.

MYTH: THERE ARE NO EFFECTIVE TREATMENTS FOR DOWN SYNDROME

Researchers are making great strides in identifying the genes on chromosome 21 that cause the characteristics of Down syndrome. Scientists now feel strongly that it will be possible to improve, correct or prevent many of the problems associated with Down syndrome in the future. Particularly encouraging is the establishment of the Stanford Center for Research and Treatment of Down Syndrome, whose mission is to conduct research and develop treatments related to the cognitive disabilities related to Down syndrome.

MYTH: CHILDREN WITH DOWN SYNDROME WILL NEVER GROW UP TO BE INDEPENDENT

Parents of individuals with Down syndrome and society-at-large are coming to understand the abilities and aspirations of persons with Down syndrome to participate in all aspects of community life: education, recreation, employment, socialization and family life.

MYTH: HAVING A SIBLING WITH DOWN SYNDROME WILL BE A HARDSHIP FOR YOUR “TYPICAL” CHILD(REN)

Most families report that their “typical” kids are more compassionate, patient and tolerant of all people because of their experiences having a sibling with Down syndrome. The sibling relationship is generally a typical one — full of love, occasional arguments and just being together.

People First Language

It is estimated that one in five Americans has a disability. Oftentimes, society makes assumptions, based on a person's diagnosis, about how a student should be educated, what his potential is, where and how he will live and what "services" he needs. Negative stereotypes and the inappropriate use of medical diagnoses have led people across the country to advocate for "People First Language."

IN YOUR LANGUAGE (BOTH WRITTEN AND ORAL), PUT THE PERSON BEFORE THE DISABILITY

- ✓ Use "My student with Down syndrome" rather than "my Downs student" or "he's Downs."
- ✓ Say "My student receives special ed services" rather than "he's a special ed student."
- ✓ Encourage all students to think of students with Down syndrome as people first.

RECOGNIZE THAT WORDS CAN CREATE BARRIERS

- ✓ Avoid terms with obvious negative connotations, such as "retarded."
- ✓ "Developmentally delayed" is preferable to potentially offensive words like "mentally retarded," "disabled" or "handicapped."
- ✓ If you aren't sure how to refer to the student's condition, ask the parent.
- ✓ Try to describe people without disabilities as "typically-developing" rather than "normal."

USE EMOTIONALLY NEUTRAL EXPRESSIONS

- ✓ A person "has" Down syndrome, rather than "suffers from," "is a victim of" or "afflicted by."
- ✓ Say "My student has Down syndrome" rather than "my student suffers from Down syndrome."

AVOID USE OF STEREOTYPES

- ✓ Try not to use the clichés that are so common when describing an individual with Down syndrome.
- ✓ Avoid saying "They are so loving/happy all the time." Individuals with Down syndrome experience a wide range of emotions and are not all alike.
- ✓ Recognize that a student is "a student with Down syndrome," and an adult is "an adult with Down syndrome."

USE EXAMPLES OF WHAT CHILDREN NEED RATHER THAN LABELING THEM AS HAVING "PROBLEMS"

- ✓ Use "Billy needs . . ." rather than "Billy has problems or special needs."

AVOID USE OF TERMS "MILD" OR "SEVERE"

- ✓ A person either has Down syndrome or does not. While there are varying degrees of abilities, using "mild" or "severe" can be insulting to parents or other families who overhear.

Inclusion

What is Inclusion?

Inclusion is a philosophy of education based on a belief in every person's inherent right to fully participate in society. It implies acceptance of differences and access to the educational experiences that are fundamental to every student's development.

When effectively implemented, research has demonstrated that inclusion offers academic and social benefits for all students – both those who have special needs and those who do not. Friendships develop, typically-developing students are more appreciative of differences and students with disabilities are more motivated. True acceptance of diversity ultimately develops within the school environment and is then carried into the home, workplace and community.

THE EDUCATIONAL CHALLENGES INCLUSION STUDY

In a 1996 study conducted on behalf of the National Down Syndrome Society (NDSS), parents of children with Down syndrome described multiple benefits of successful inclusion experiences, including higher self-esteem, independence in daily living skills, greater academic achievement, positive social interactions and improved speech and communication.

They reported that the following factors had the most significant relationship to successful inclusion experiences:

- ✓ Teacher preparation
- ✓ Format of the curriculum (lesson plans and materials)
- ✓ Classroom management and curricular style of the teacher
- ✓ Collaboration between special and general education
- ✓ Parental confidence in professionals
- ✓ Attitude of professionals (open-mindedness, enthusiasm and confidence were cited as helpful character traits for successful inclusion)
- ✓ Contact, encouragement from and friendships with peers

Schools that are successful in integrating students with Down syndrome have the following attributes:

- ✓ Effective leadership from a head teacher who is committed to meeting the needs of all pupils
- ✓ Confidence amongst staff in dealing with students' individual needs
- ✓ A sense of optimism that all pupils can succeed
- ✓ Arrangements for supporting individual members of staff;
- ✓ A commitment to provide a broad and balanced range of curriculum for all students
- ✓ A systematic procedure for monitoring and reviewing progress

Conditions for Successful Inclusion

Students with Down syndrome benefit from education in the general education classroom setting when schools implement "best practices," such as the following:

- ✓ View special education as a collection of supports and services, rather than as a place
- ✓ Remove barriers that are created by dual systems (general and special education) and provide access to the resources and expertise of both
- ✓ Maintain respectful attitudes toward students and their families
- ✓ Encourage meaningful participation from parents as equal members of the IEP team

- ✓ Have high expectations of all students
- ✓ Provide access to the same academic curriculum, with or without adaptations, as students without disabilities
- ✓ Proactively use positive behavior support strategies
- ✓ Provide access to and training for assistive technology
- ✓ Facilitate and support peer relationships and interactions using deliberate strategies
- ✓ Plan and implement transition
- ✓ Emphasize staff development and training
- ✓ Foster a strong sense of community among students, staff and parents

Parents also can, and should, contribute to their student's success in inclusive settings by way of the following:

- ✓ Maintain the same expectations of behavior for students with Down syndrome as for any other student
- ✓ Teach students with Down syndrome how to behave and interact with others in a socially acceptable way, e.g., taking turns and sharing
- ✓ Teach appropriate reactions and responses in the school environment, e.g., greeting and asking for help
- ✓ Foster independence and cooperation
- ✓ Teach self-help and practical skills
- ✓ Develop an effective home-school communication system
- ✓ Be involved in school activities
- ✓ Do additional activities at home to reinforce what the student is learning at school

Practical Tips to Achieve Inclusion

LONG TERM GOALS

Parents should tell the IEP team that they want to prepare their child to live and work as independently as possible. This means being able to function and behave appropriately in a world of typical peers. The goals on the student's IEP should reflect the skills necessary to achieve this — both academic and nonacademic.

Parents should acknowledge their high, but reasonable, expectations and inform the IEP team that they will support them in any way possible. It is critical that the IEP team sees the student's future through both the parents' and the student's eyes.

DRAFTING IEP GOALS FOR INCLUSIVE SETTINGS

The goals for the student drive placement decisions at IEP meetings. As long as the student can make progress toward her goals in an inclusive environment, the team should not consider a more restrictive placement. It is important that these goals be appropriate for the general education classroom. For example, if the student's IEP includes a goal that specifically requires trips into the community, it cannot be met in an inclusive environment; if her goal is to learn to handle money in real-life situations, the goal can be written in a way that uses the cafeteria or the school store, rather than the mall or McDonald's.

It also helps to have social goals that involve interactions with typical peers, which cannot be worked on in segregated settings. The goals should not be restricted to "small group settings." Even though small groups can be arranged in the general education classroom, the term "small group setting" is often considered to be synonymous with a special education class.

PLANNING MATRIX

A chart should be used to show how the student's goals can be worked on in the different parts of a typical school day. For example, the schedule may indicate that the student will work on money at lunchtime, communication and reading skills throughout the day and one-to-one correspondence during math — by handing out dittos (assignment sheets) to each classmate. By demonstrating to the IEP team and school personnel that including a student with special needs in the general education classroom just takes a little creativity and flexibility, the concept of inclusion becomes less threatening.

SUPPLEMENTARY AIDS AND SERVICES

All the supports and services that the student and teacher will need should be reflected in the IEP. Examples include curriculum modifications; assistive technology; augmentative communication; paraprofessional support; a behavior plan; staff training; staff collaboration time; psychological support; and occupational, speech and physical therapy. The student's need for these supports is not grounds for a more restrictive placement unless they cannot be provided at the school. It is not enough for the school to say it does not have these services; efforts must be made to bring the services to the school, through traveling staff or some other means.

Students with Down Syndrome and the General Education Classroom

Health Conditions Associated with Down Syndrome

One factor that teachers must consider is the effect that chronic health problems have on learning. By the time they reach school-age, many young children with Down syndrome have had multiple surgical procedures. Although they seem resilient, chronic health issues can take their toll. General health may be poor, students may have problems with eating or sleeping, or they may suffer from chronic ear or sinus infections.

In general, the following reminders and practices will promote improved classroom success:

- ✓ Be aware of physical characteristics and health conditions that may affect classroom success. It is important to note that behaviors you witness in the classroom may have a medical or health basis. Speak with the student's parents to identify previous health conditions and ongoing medications, as these can affect ability to listen and follow directions. Recognize that unusual behaviors or situational responses may signal an illness which the child is unable to communicate.
- ✓ Ask parents to alert you to changes in their child's health or sleeping patterns, as these factors can detract from their ability to solve problems. Schedule the most challenging academic areas in the morning. Tiredness at the end of the school day can significantly increase the time required to process information or directions and cause frustration and perceived behavior problems.
- ✓ Students with Down syndrome may require additional recovery time from illness; consider alternative activities and additional periods of rest in these cases. Recognize that non-routine activities (field trips, parties, etc.) can be physically or emotionally draining for students with Down syndrome. Avoid situations that set up a student for failure.

The following are some of the physical characteristics and health conditions that may affect the classroom success of students with Down syndrome:

MUSCLE HYPOTONIA

Hypotonia is a medical term used to describe decreased muscle tone (the amount of resistance to movement in a muscle). Symptoms of hypotonia include problems with mobility and posture, breathing and speech difficulties, lethargy, ligament and joint laxity, and poor reflexes.

To understand the physical demands that low muscle tone places on children with Down syndrome, imagine cooking dinner while wearing socks on your hands. Students with Down syndrome can get frustrated when their abilities to complete tasks are hindered by low muscle tone. Muscle development can require repetitive training.

- ✓ Allow extra time for a student with Down syndrome to complete tasks.
- ✓ Provide increased opportunities for practice.
- ✓ Work with physical therapists to identify and improve specific muscle development needs.
- ✓ To support fine motor development, use wrist and finger strengthening activities. Multisensory activities and materials work well. Provide opportunities to practice self-help skills such as using buttons and zippers.

SPEECH INTELLIGIBILITY

Speech intelligibility refers to the ability to be understood when speaking orally. This can be difficult for students with Down syndrome because of low muscle tone, jaw movement difficulties and motor planning difficulties.

To understand how your student with Down syndrome may feel, imagine communicating your needs while your mouth is full.

- ✓ Upon evaluation, many students with Down syndrome exhibit great differences between receptive (understanding) and expressive (spoken language production) language abilities. For this reason, their intelligence is often underestimated.
- ✓ Recognize that situational factors can impact communication and classroom performance, e.g., an impatient listener, anxiety, perceived pressure, embarrassment or lack of confidence.
- ✓ Use simple questions (5Ws and H), and allow extra response time. If your student uses American Sign Language (ASL), learn basic signs and teach them to the class.
- ✓ Peer group acceptance may hinge on the ability to communicate intelligibly. Goals for the classroom should include teaching the student with Down syndrome to communicate, in addition to teaching peers how to engage in meaningful interactions.
- ✓ Work with your district's therapists to assist students with Down syndrome:
 - Speech therapists can design a speech remediation component to the IEP.
 - Occupational therapists can work on postural control required for speech.
 - Audiologists measure a child's ability to hear.
 - Aides can provide one-to-one instruction for articulation skills.
- ✓ Students may exhibit an increase in stuttering when under stress. Attempt to ease stress by increasing the comfort level of the classroom.

MEMORY

Most students with Down syndrome will have short term or working memory difficulties. This makes it harder for them to access, understand and process information at the speed of other students, but it does not prevent them from learning the same information. Individual motivation is the key to learning!

Present information in a clear, ordered manner. Explain the links between information to build a system of knowledge.

- ✓ Allow more time to learn.
- ✓ Allow more practice to apply knowledge.

COMPACT STRUCTURE OF EAR, NOSE AND THROAT

Students with Down syndrome typically have compact bone and soft tissue structure of the ear, nose and throat. This increases their susceptibility to, and the severity of, upper respiratory and sinus infections. It may also increase sensitivity to loud sounds or vibrations. A child with Down syndrome may cover his ears or avoid activities that create loud noises. Be aware of the activity noise levels in and around your classroom. If appropriate, headphones can limit auditory distractions.

SLEEP APNEA

Recent studies indicate that as many as forty-five percent of individuals with Down syndrome may suffer from sleep apnea. This is the term used when someone stops breathing for very short periods of time, usually ten to twenty seconds, during sleep. Sleep apnea can cause memory loss and intellectual impairment, and may make a student more tired and lethargic. Alternatively, it may result in hyperactivity (which is often inaccurately interpreted as an attention deficit disorder). If you recognize these issues in a student with Down syndrome, explore sleep patterns (including snoring) with parents. Medical interventions can improve your student's quality of life and school performance.

HEARING, VISION AND THYROID PROBLEMS

It is estimated that sixty-five to eighty percent of children with Down syndrome have conductive hearing loss, and that fifty percent have vision problems. There is also a higher rate of hypothyroidism, which can cause sluggishness, weight gain and mental impairment.

Perform an annual hearing and vision screening. Note that hearing loss may fluctuate when fluid is present or when a student is experiencing ear pain. A student may not be “ignoring” your instructions, but may not be able to hear you. Inform parents of your observations. When left untreated, these problems can significantly affect a student’s ability to succeed academically and socially.

The following tips and tactics are recommended to improve the listening environment:

- ✓ Place the student at the front of the class.
- ✓ Speak directly to the student and supplement with signs, gestures or expressions.
- ✓ Use visual aids, e.g., write on the board.
- ✓ Rephrase and repeat questions or instructions often.

The following tips and tactics are recommended to support visual skills:

- ✓ Place the student at the front of the class.
- ✓ Use larger font.
- ✓ Use visual aids, e.g., signs on floors or walls.

HEART CONDITIONS

Forty to forty-five percent of children with Down syndrome have congenital heart disease. Many of these children will have to undergo cardiac surgery and can participate in classroom activities without restrictions. If a student has had or is scheduled to have surgery, ask the parents if it is appropriate to teach his or her classmates about the condition.

Modifying the Curriculum for Students with Down Syndrome

Individuals with Down syndrome have varying degrees of abilities, skills, behavior and physical development. Their learning deficits result from different learning styles rather than learning impediments. As a general rule, students with Down syndrome need activities that are more highly structured and sequenced, small amounts of information presented at a time and a good reward system. Teachers can use some of the tips and tactics below in their classrooms to maximize the classroom experience.

AREA	LEARNING STYLE	TIPS AND TACTICS
Classroom Information and Curriculum	Students with Down syndrome are visual learners.	- Use teaching methods that involve cues and objects. - Pair pictures with spoken words. - Present information visually, e.g., overhead projector, posters, pocket charts, chalkboard.
	They may suffer some degree of hearing loss and have fewer short-term memory channels.	- Use simple directions. - Break down directions into small steps.
	- They are not proficient in auditory processing and auditory memory. - They have some difficulty retaining directions or information that is only processed verbally.	Allow adequate response time.
	- They need time to process new skills they have learned before moving on to others. - They have a slower rate of learning in comparison to their peers.	- Assign fewer problems to a page. - Give students more freedom to choose their work activities. - Foster independence and self-reliance by balancing developmental and chronological needs as higher academic expectations are set in the classroom. - When presenting independent work, try to divide it into small segments, e.g., fold a test in half. - Allow extra time to complete tasks. - Reduce length of assignments.
Teacher Arrangement and Instructional Methods	Students with Down syndrome work best with one-on-one or small group instruction.	Avoid large group and whole class instruction, as they are least effective.
	Working with teaching assistants or aides can be effective.	- While aides can be effective, some parents caution that they can isolate a student and discourage peer interaction. - Provide lesson plans to assistants in advance to give them more confidence with the lesson, and allow them time to develop their own ideas for suitable practical materials and resources.
	Computer-assisted instruction can be effective because it is interactive, self-paced and nonthreatening.	- Be aware that some students may lack the fine motor coordination to use a keyboard and mouse effectively. - Assistive and/or adaptive equipment, such as specialized key guards or an alternative keyboard, can be used.
	Peer tutors are sometimes effective.	Students may work harder to be independent and accepted by their peers.
	Communication with parents is necessary for success.	Use daily notebooks to communicate with parents.

AREA	LEARNING STYLE	TIPS AND TACTICS
Materials Used	Concrete or “hands-on” materials are most effective for students with Down syndrome.	- Workbooks are not generally effective. - Paper and pencil tasks, the computer and textbooks are sometimes effective in the upper grades. - Manipulatives are useful. - Use “hands-on” materials in creative ways, e.g., throw a soft ball at a student if you want him or her to answer a question. - Assist students with exercise before writing, e.g. push palms together, push hard on the desktop, squeeze and relax fists. - Have a variety of multilevel reading books in your class. - Homework is effective: (a) to inform parents about what child is doing in school and (b) to provide extra practice with basic concepts.
Transitions		- Change of location and subject teachers can be refreshing for students with Down syndrome. - Breaks between classes can allow for valuable social interaction with peers, as well as exercise. - When students are ready, or upon request, they should be allowed to change classes independently, meet aides at arranged classrooms and spend lunch and break times with their peers. - If students need assistance, it is preferable to use peer support rather than adult staff support during these times.
Attention	- The building block of all learning is attention. - Researchers have developed a two-stage theory of attention: → Stage 1: Ability to attend to a task → Stage 2: Ability to identify relevant stimulus to the problem - Students with Down syndrome may have a hard time paying attention to tasks, but once Stage 1 is mastered, they are able to learn the task and learn well.	- The goal in early childhood is at least a 15-20 minute attention span. Attention can be trained. - Minimize distractions. When choosing stimuli or objects, ensure that they have clear and obvious dimensions that vary on as few dimensions as possible, e.g., color, size, texture. - Use prompts, cues and lighting to capture the student’s attention. - Try using differently colored or textured backgrounds for work. - Minimize or remove distractions by placing fewer pictures on the wall or problems on a page. - Pay attention to seating. Avoid seating students with Down syndrome near a window, door or high traffic area. - Give immediate feedback or praise to ensure that students associate rewards with their efforts.
Sensory/Motor Difficulties	Students with Down syndrome may have difficulty processing information from many sources at once, doing more than one thing at a time or responding quickly to some situations.	- Focus on one sense at a time or completing one task at a time. - Look at the student to give directions; look away while he is processing the request. - A student may not be able to sit on the floor without back support; use a chair, pillow or prop. - Ensure the student is seated at a desk that is the right size, with the feet supported, elbows at a 45-degree angle from the desktop and the back supported. - Uneven surfaces may be difficult to navigate. Allow the student to practice walking on these surfaces.

AREA	LEARNING STYLE	TIPS AND TACTICS
Memory	- Individuals with Down syndrome have poor memory ability for three reasons: 1. They are at a disadvantage for adequate short-term memory due to language delays. 2. They have a limited repertoire of memory strategies. 3. They tend to be “inactive” learners when it comes to memory.	- Use labeling or verbal associations. - Break information down into small clusters and sequence ideas. - Make tasks interesting and meaningful for the student. - Teach rehearsal strategies. - Provide opportunities to practice in different contexts, and use multisensory approaches (hands-on activities tend to work best). - Show patterns and teach memory tricks. - Repetition is the key to learning!
Concept Attainment	- Students with Down syndrome may function at a mental stage below their chronological age. - Once you figure out what mental stage a student is at, you can determine how to adapt your lessons to meet his needs and play to his strengths. “Concept attainment” describes the difference between mental stage and chronological age. A 1997 study identified four developmental stages for the acquisition of cognitive skills (at right).	- Figure out a student’s mental stage rather than focusing on chronological age: 1. Sensorimotor – The environment is experienced via sensory and motor encounters. The student learns to distinguish himself from the world. 2. Preoperational – Concepts are absorbed via language and thought. The student remembers past events and forms future expectations. 3. Concrete Operations – Objects are ordered and classified through logic. The student needs to manipulate objects to solve problems or learn cause and affect relationships. 4. Formal Operations – Abstract reasoning develops. The student can link concepts, mentally use symbols, hypothesize and predict consequences or events. - If a student functions in the concrete operation stage, use objects and other items to help with conceptual tasks, such as math (tokens, rods, etc.). These will help students solve problems and maintain interest. - Learning is sequential. Break down tasks into steps. - Students build on what they know. Before teaching new concepts, ensure that they have the requisite background knowledge to be successful. - Repetition is the key to learning!
Mediation Strategies and Paired Associates	“Serial learning” describes the concept of getting from concept A to conclusion C (“If I touch the stove, I’ll get burned”). “Paired associates” is the ability to link concepts, ideas and words. “Mediation strategies” are prompts or cues (the “B”). Using the example above, A to B would be “The stove is hot,” and B to C would be “if I touch something hot, it burns my hand.” - Students with Down syndrome typically need more assistance with abstract concepts, but can be taught to break down and combine concepts through use of mediation strategies.	- Introduce a mediator to break down concepts that are too abstract for your student to grasp. - Use materials that are familiar and meaningful. - Break down relationships to basic concepts or categories (size, shape, color). - Sequence activities from simple to complex. - Increase response time. - Verbalize and repeat the “B” — the link between concepts. - Repetition is the key to learning!

AREA	LEARNING STYLE	TIPS AND TACTICS
Transfer of Learning (Generalization)	• “Transfer of Learning” refers to the ability to apply old knowledge or skills in a different situation or environment, e.g., ability to do math at school but not at the grocery store. • Teachers also report that students with Down syndrome seem to forget learned skills from one day to the next, as previous learning is often not transferred to future experiences.	• Teach and practice new concepts and skills in several different environments, and utilize different materials and people. Point out similarities and/or differences. • Materials should be meaningful to the student. • Use verbal explanations as well as hands-on activities. • Repetition is the key to learning!
Motivation	• Students with Down syndrome may need more encouragement and positive feedback than other students. • By the time they get to your class, they likely have experienced multiple delays, negative responses from adults or other children and frequent criticism or correction. • They may have developed coping mechanisms such as passive behavior, avoidance or learned helplessness (giving up and waiting for someone else to answer for them). They may also depend on external cues (“external locus of control”).	• Assign well-explained tasks that are suitable for the student’s mental stage. • Materials should be meaningful and familiar. • Allow students to help develop rules or the lesson design. • Use positive language. Rather than saying “That’s wrong,” say, “Try another way.” • Encourage peer buddies and social rewards. • Reward independence. • Help students maintain motivation and develop an internally-based reward system by gradually fading out your cues and rewards.

Reading

Reading is important for all students. It provides students with means to obtain information and gain enjoyment, and it facilitates social relationships (Downing, 2005). For many students with Down syndrome, reading is strength. Research demonstrates that teaching reading to students with Down syndrome enhances and facilitates language development because typically they are visual learners. As their reading ability increases, so does articulation and vocabulary. Since reading is language made visual, it is the ideal means of helping a student with Down syndrome with expressive language, which is normally a deficit area for students with Down syndrome (Kotlinski & Kotlinski, 2002).

The ability to read and the praise it elicits from others correlates with higher self-esteem and independent performance. Reading is also beneficial for the development of functional skills required for personal development, community life, a career and recreation. Teachers should strive to incorporate effective reading instruction for both practical and functional skills into the reading curriculum (DeutschSmith, 2006).

READING READINESS

There are several skills that can prepare students for success in reading:

SKILL	STRATEGIES FOR CLASSROOM OR HOME
Attending Skills – the ability to behave appropriately in a given situation, e.g., sitting at a desk or in a circle, looking at the teacher	• Minimize distractions. • Teach and practice the required skills. • Seat students with Down syndrome near the teacher.
Visual Discrimination – the ability to differentiate between objects based on a set of criteria, e.g., color, shape, size • Students must also be able to grasp the concepts of same and different.	• Simplify choices. • Use meaningful visual aids, e.g., photos of items that interest the student. • Progressively make problems more difficult as the student is ready.
Memory – the ability to recall sounds and words, and imitate them spontaneously or upon request • Students with Down syndrome tend to learn more slowly than their typically-developing peers. • They may forget previously learned skills.	• Expose a student to music and beat from an early age. • Encourage singing, clapping and dancing. • Repeat finger plays, nursery rhymes and songs for help with retention and recollection of vocabulary. • Seek creative and active ways to build a student’s vocabulary of meaningful words. • Use visual and sensory cues, e.g., pair actions with words, finger cuing and pacing. • Use tactile approaches, e.g., sandpaper words or drawing in finger paints or sand. • Repeat instructions or break down into smaller steps, • Review and practice learned skills.
Auditory Discrimination – the ability to identify and distinguish between different sounds	• Teach good listening skills. • Use tactile and visual cues. • Use spelling to reinforce auditory discrimination.

Likewise, a teacher’s expectations, skill, methods and flexibility contribute to a student’s overall success with reading. It is important to recognize that opportunities for reading instruction in the general education classroom are unlimited. Reading instruction and activities can be incorporated into other subjects such as math, social studies or science.

Classroom Strategies:

- ✓ Use materials and activities that reflect the student's interests and are age-appropriate, i.e., as students age, materials should reflect their growth and development.
- ✓ Develop a planning matrix that identifies a student's reading opportunities during the school day.
- ✓ Incorporate visual and tactile cues.
- ✓ Give students opportunities for practice.
- ✓ Review "learned" concepts frequently to encourage retention.
- ✓ Maintain high expectations for your student(s) with Down syndrome.

EARLY READING AND LITERACY DEVELOPMENT

Language is the building block of any effective reading program. However, students with Down syndrome display significant delays in speech and language attainment relative to their nonverbal mental ability (Rondal & Buckley, 2003). Hearing loss, auditory processing and short-term memory difficulties can affect speech and cause language delays. Therefore, it is difficult for students with Down syndrome to learn language from listening to verbal communication.

Reading allows students with Down syndrome to view language visually. Printed text provides students with Down syndrome a permanent transitory signal. As a result, students are allowed more time to process information and more opportunities to learn. When introduced to reading as early as two to three years of age, children with Down syndrome show significantly advanced speech, language, literacy and memory skills in childhood and teenage years (Rondal & Buckley, 2003). Therefore, it is particularly important to start reading instruction for students with Down syndrome as early as preschool.

Early Intervention Strategies for the Classroom and the Home:

- ✓ Expose children to books and word games at an early age.
- ✓ Encourage parents to read to children regularly as part of the daily family routine.
- ✓ Teach children listening and attending skills. Some prerequisite skills include the ability to do the following:
 - Sit quietly and listen to a book.
 - Point to pictures.
 - Request a book or read independently.
 - Hold a book right side up and read from left to right.
 - "Finger track."
 - Predict what will happen next.
 - Paraphrase what the book is about.

TEACHING SIGHT WORDS (LOGOGRAPHIC READING)

Reading instruction for students with Down syndrome should typically begin with sight word or automatic recognition activities. Research shows that preschool students with Down syndrome are able to learn sight words at the same pace as preschool children without any disabilities (Appleton, Buckley, & MacDonald, 2002). Students with Down syndrome can learn to sight read before becoming competent verbal communicators. Those with limited verbal ability are able to expand both their receptive and expressive language skills by learning to read (Sue Buckley, 1996, 1997).

Sight word instruction involves teaching the association between a word and the thing or idea that the word represents, e.g., pairing the "apple" with a picture of an apple. Sight word instruction should be meaningful and useful to the student. Start with words and concepts that the student already understands. Gradually incorporate sight words into sentences and encourage students to repeat words and sentences.

Classroom Strategies

- ✓ Over time, have the student combine previously learned words to form short phrases of two to three words.
- ✓ Create books with students based on the sight words and sentences they are learning, and give them frequent opportunities to read the books (Copeland & Calhoun, 2007).
- ✓ Play games using the sight words.
- ✓ Practice in natural settings is essential. Traditionally, sight word instruction occurs in a decontextualized way, such as through flashcards. However, students should be given ample opportunities to practice sight word recognition in natural settings. Label items in the classroom and review the words with the whole class on a daily basis.
- ✓ Create sentence strips or Velcro cards and have students progress from copying a sentence structure to creating their own sentences in response to a photo or picture.
- ✓ Emphasize and provide practice with connecting words, e.g., “and,” “or,” “but.”
- ✓ Use repetitive sentence patterns to help students match words to pictures, as well as sequence, predict and expand on their sight words, e.g., “I like...” and “May I have...”

METHODS FOR TEACHING SIGHT WORDS	
Pair Pictures and Words	• Pairing pictures with words is the most popular sight word instructional technique among educators. However, there is evidence that students may subsequently associate the spoken word with the picture rather than with the printed word (Copeland & Calhoun, 2007). With “stimulus fading,” a picture is paired with a word on a flashcard. The picture is slowly faded from the flashcard, leaving only the word. • Once students can pair pictures, move on to matching words. Start with two to four words that are familiar to and meaningful for the student, e.g., family names. Make two sets of identical cards and have the student match the words. Use pictures on the back of the cards, and fade them over time.
Match, Select and Name	• Step 1: Matching words together • Step 2: Selecting words upon request, e.g., “Give me ‘Dog.’” • Step 3: Naming, e.g., hold up a card and ask, “What does this say?” • Start with two to four words that are meaningful for the student and gradually add words over time.
Copy, Cover and Compare	• “Copy, cover and compare” is another method used in the development of reading and writing skills. • A student is given a paper arranged in three sections. Section one contains the sight word. In section two, the word is printed in dashes. The last section is left blank. After the student has stated the sight word, she traces the sight word using the dashes in section two. As the student traces the sight word, she states the letters in the sight word as well as the sight word. Once she has completed sections one and two, the letters should be covered with another piece of paper. In section three, the student must write the word from memory, again stating the sight word and the letters in the sight word. Finally, the cover is removed so the teacher and student may compare work.
Response Prompts	• “Response prompts” refers to any assistance a teacher gives a student that increases the likelihood that the student will respond correctly (Copeland & Calhoun, 2007). • “Progressive time delay” is one method of response prompts. A student is given a cue to stimulate a response. The student is then given a prompt to solicit the correct answer. Gradually the prompt is delayed until, with practice, the student no longer needs a prompt to solicit the correct answer.

READING COMPREHENSION

As a student’s sight word bank grows, it is important to introduce comprehension strategies. These will reinforce learning and ensure that the student understands the meaning behind the words he is reading.

Classroom Strategies:

- ✓ Take frequent breaks to determine the students’ comprehension level, e.g., ask questions (5Ws and 1H), request a summary of the story, predict what will happen next, clarify any text you think they may not understand.
- ✓ Encourage students to ask questions when they do not understand.
- ✓ For older students, use cue cards so that they can self-check their level of comprehension. This will also reinforce self-help skills.

TEACHING PHONICS (ALPHABETIC READING)

Phonics is the relationship between letter and sound. Acquiring and applying basic phonic knowledge can be helpful to students when they encounter unfamiliar words (Copeland & Calhoon, 2007). Phonics can be difficult for students with Down syndrome because they generally exhibit auditory memory deficits, and many have trouble hearing and discriminating between sounds. Many students with Down syndrome exhibit increased phonological awareness when they reach the word reading skills of a typically-developing seven- to eight-year-old, or once the student has a sight vocabulary of approximately fifty words.

There are two basic approaches to teaching phonics: implicit/analytic phonics and explicit/synthetic phonics. Implicit/analytic phonics focuses on analyzing letters and sounds within familiar words. Students look at the whole word, then analyze the sounds of each letter in the word. Explicit/synthetic phonics focuses on teaching isolated letter and sound relationships. Once the student has learned the letters and sounds, she is taught to blend sounds in order to decode words.

Classroom Strategies:

- ✓ Provide opportunities for daily practice.
- ✓ Use visual cues, e.g., an alphabet line, finger cuing; and tactile cues, e.g., popping lips, to teach students to “feel” how sounds are made.
- ✓ Encourage practice in a mirror.
- ✓ Use sensory-related cues, e.g., “What shape is my mouth making?” “What sound do you hear with your ears?”

Older students should be given daily opportunities to write. Reading and writing are interrelated. Writing allows a student to record his thoughts and read the written text several times. Participation in writing activities allows the students to develop a deeper understanding of literacy and the use of print (Copeland, 2007). Writing does not necessarily mean that the student has to handwrite the words; he may use words, symbols and pictures.

EVALUATE STUDENT PROGRESS

Evaluation of a student’s progress is essential and should focus on areas of success and need for change. Standardized methods of assessment may not be effective for students with Down syndrome; thus, teachers should seek alternative assessment procedures, such as teacher-student conferences, observation of the student in the classroom or a review of past work. One type of alternative assessment procedure is to keep a portfolio of the student’s progress and work during the school year.

Have high expectations for student development. Link a student’s evaluation to core curriculum standards that have been accommodated to the student’s abilities. Ensure that modifications are not so oversimplified that the original goals of the core curriculum standard(s) are lost.

Finally, make reading fun. The aim is to engage the student in intellectual stimuli that promote the development of language, speech, communication and literacy skills and provide a lifetime of enjoyment.

Math

Math skills are essential for day-to-day independent living. Unfortunately, reform in mathematics education has been slow to address the needs of students with disabilities (Mastropieri & Scruggs, 2002). Traditionally, the mathematics curriculum for students with disabilities was developed using a functional curriculum approach which focuses on “life skills” (DeutschSmith, 2006). Students were taught mathematics through basic skills required for “personal maintenance and development, homemaking and community life, work and career, recreational activities, and travel within the community.” For instance, mathematics instruction would include topics such as telling time, making change, money skills and cooking measurements. However, many educators utilizing this approach tend to simplify the importance of the underlying math concept being taught. For instance, instead of a student learning how to use basic operations like addition, subtraction, multiplication and division, the lesson often turns into instruction on how to bake a cake.

Students with Down syndrome can learn mathematic concepts. In fact, learning mathematic concepts will motivate students with Down syndrome to apply these skills to different situations not demonstrated in the classroom; further, teachers must provide students opportunities to practice these skills in different settings to promote the transfer of learning/generalization.

It is important to recognize that deficits in learning math often reflect a lack of teaching, rather than a lack of ability to master mathematic concepts.

MATHEMATIC ASSESSMENT

Standardized assessment tests do not always provide educators with information regarding specific skills students have or have not mastered, nor do they specify which techniques are most effective for the student. Educators must take the extra step to evaluate student performance by analyzing each student on an individual basis:

- ✓ Is the instructional format still optimal?
- ✓ Is the student mastering the skills at an appropriate rate?
- ✓ Is the student retaining previously mastered skills?
- ✓ Is the student applying mathematic concepts to other areas in the general curriculum?

Once the necessary information is gathered, an educator can develop an effective individual education plan for math instruction that addresses the student’s needs. Plans should build on students’ strengths and develop strategies for them to overcome or compensate for areas of weakness.

DIFFICULTIES AND STRENGTHS IN MATHEMATICS FOR STUDENTS WITH DOWN SYNDROME

Students with Down syndrome can learn mathematics at any age. They are helped most by teaching methods which incorporate research-based methods for addressing their strengths, e.g., social understanding and interactions, visual processing and visual memory, use of gestures to communicate; and weaknesses, e.g., motor skill delays, speech and language delays, auditory processing and working memory difficulties.

The difficulties and strengths listed below have been observed in many students with Down syndrome, though not in all. It is important to note that many of the students who displayed difficulties were able to overcome or compensate for them with proper instruction (Martinez, 2002).

STRENGTHS	CLASSROOM STRATEGIES
Visual Processing – Students with Down syndrome can better solve problems and follow procedures if information is presented visually.	• Teach students to sketch out problems and write the arithmetic for the solution afterwards. • Draw a graph/chart/picture. • Act problems out. • Make a step-by-step video. • Use number lines.

STRENGTHS	CLASSROOM STRATEGIES
Practice Makes Perfect – Practice leads to retention, and more practice (over-learning) leads to automatization. At this point, skills require less conscious effort, and working memory is freed up for mental processing during tasks.	• Review and repetition are crucial to success. • Build on prior knowledge. Review learned concepts at the beginning of each math lesson. • Practicing concepts improves memory retrieval and the amount of effort needed to complete a task. • Practice skills in different contexts and with varied materials. • Use a planning matrix to determine opportunities for teaching mathematical concepts outside of “math class.” • Practice should be fun, varied in content and relevant to real life.
Accommodations	• Assign fewer problems. • Allow more time. • Minimize noise and distractions. • Use the student’s real word interests and experiences. • Utilize hands-on learning, e.g., manipulatives or common classroom items. • Use number lines to count number sequences. • Use classroom modeling, e.g., show the student what the completed project will look like, and make deliberate mistakes so you can model problem-solving strategies. • Encourage peer teaching.
Junior High and High School	• Teach real world, independent living skills, e.g., using currency, banking and budgeting, telling time, shopping, cooking. • Work on memorization of important numbers, e.g., bank card passwords, phone numbers, locker combinations. • Students with Down syndrome can be taught when and how to use technology for mathematics, i.e., computers, calculators.
Manipulatives	• Aides can create manipulatives and encourage students to verbalize steps as they are working (this will help with math vocabulary and sequencing). • Examples of manipulatives include games, e.g., Candyland, Chutes and Ladders, Monopoly, dice, cards; felt boards; personalized books; numicon plates and materials; and sorting containers, e.g., boxes, jars, bowls. • Skills that can be taught with manipulatives include the following: → Sorting and classification, e.g., solving puzzles of increasing complexity; matching objects and pictures; sorting by color, shape, size or function; sorting by opposites or exclusion → Sequencing and patterns, e.g., beads or stacking cups; sequencing cards that teach first, next, last; pictures that tell a story or describe past events when arranged properly

WEAKNESSES	CLASSROOM STRATEGIES
Memory – Students with Down syndrome often have difficulty with their short-term memory spans and organization, in addition to long-term memory. They may display difficulty with rote memorization of mathematical concepts, e.g. math vocabulary multiplication tables, counting backward, sequencing steps of problem solving. Also, they may display inconsistencies in learned concepts, i.e., “forgetting” skills they displayed the day before.	• Start each math lesson with a review of concepts covered in the previous lesson. Use direct teacher questioning to solicit responses from students. When appropriate, offer corrective feedback based on the student’s performance. Practicing concepts improves memory retrieval and amount of effort to complete task (Nye & Bird, 1996).

WEAKNESSES	CLASSROOM STRATEGIES
Information Processing – Because of difficulties processing and recalling information, timed drills can be difficult for students with Down syndrome.	• Assign fewer items and allow additional time. • Repeat group instructions. • Use visual aids. • Practice math vocabulary and steps, and review concepts often. • When presenting new material, first clarify the goals and main objective (Mastropieri & Scruggs, 2002).
Abstract Thinking – Concrete learning is generally a strength for students with Down syndrome, but abstract thinking skills, e.g., subtraction, the decimal system, complex calculations, values of digits, are more difficult. Many students exhibit difficulties with sequencing and problem-solving.	• Use purposeful activities that move beyond imitation and copying. Teach students what numbers actually represent. • Provide varied opportunities to distinguish differences in size, shape and quantity. • Students with Down syndrome perform well when they are given a visual illustration of the mathematical procedure. Teach them to sketch out the problem first and write the arithmetic solution on the sketch afterwards.
Vocabulary – There are many terms that students must have in their vocabulary for success in mathematics, e.g., sizes, weights, units of measurement, numbers, fractions, times, money, shapes.	• Students with Down syndrome must first acquire math vocabulary. • Teach the sequence of number words through a variety of methods, e.g., matching, sorting activities, memorization, peer tutoring. • The number sequence may not be learned with comprehension at first, but will develop over time as the student performs more number activities. Though initially some students will always start the count string at “one,” you can help them use the sequence more effectively by starting counts at other numbers. • Consider counting in sign language as a multi-sensory approach. • Do not assume that your student with Down syndrome understands the vocabulary for number work. You must develop vocabulary and related concepts when they are needed. Teach them to read the word at the same time the concept is learned. Related concepts can help them to develop greater understanding. • Use visual aids to teach math vocabulary/concepts, e.g., pictures, objects, gestures. • Use a hierarchy for teaching math vocabulary. For example, using the chart below, first teach the concept, e.g., size, weight. Then teach the vocabulary, e.g., big, small, heavy, more than.
Fine Motor Skills – Because of hypotonia (decreased muscle tone) and motor-planning difficulties, printing numerals can be frustrating and fatiguing, and turn a math lesson (understanding and processing math concepts) into a handwriting lesson.	• Ensure that math instruction time is used to master math concepts. • Allow students with Down syndrome to circle correct answers or use stamps, number cards or tiles. • Assign fewer items and allow additional time. • Use computers for older students.
Motivation – There is no bigger detriment to motivation than repeated failures when performing tasks perceived as too difficult. Remember that even the brightest of typically-developing students will lose her motivation and stop trying if she is overcorrected.	• Focus on the process rather than the end result or grade, i.e., “Wow! You did three problems correctly! Let’s go work on another one!” rather than “You failed.” • Apply mathematical concepts in various subject areas. • Repeat teaching concepts using different materials and methods. • Use teaching materials that reflect the students’ interests.

PRACTICAL ACTIVITIES TO DEVELOP THESE PRINCIPLES SHOULD BE DEvised PROGRESSING ALONG THE FOLLOWING SEQUENCE* (REPRINTED WITH PERMISSION)

1. Sort and matchlike objects by color, size and shape.
2. Write counting objects from one to ten.
3. Count up to ten objects in a row.
4. Associate numerals with the written words, spoken words and appropriate amounts.
5. Select up to five objects from a set of ten.
6. Match numerals one through five.
7. Select numerals one through five on request.
8. Sequence numerals one through five in correct order.
9. Sequence amounts one through five in correct order.
10. Identify and select the correct numeral on request.
11. Label amounts one through five with the correct numeral.
12. Copy numerals one through five on request.
13. Repeat items (v)(xii) using numerals one through ten.
14. Count left to right using one-to-one correspondence.
15. Organize materials so they can be counted accurately.
16. Perform one-digit addition, e.g., 3+4.
17. Count objects to twenty.
18. Perform one-digit subtraction, e.g., 4-2.

Communication

Effective communication has a tremendous impact on the development of students with Down syndrome. It affects their ability to become contributing members of the classroom and the community. Students feel good when others value whom they are and what they have to say. Ability and fluency in oral communication “will to a large extent determine their opportunities and options in . . . society” (DeutschSmith, 2006). Unfortunately, for many individuals with Down syndrome, the inability to communicate with others can have a devastating effect on social and personal skills.

Research indicates that the language comprehension skills in individuals with Down syndrome are almost always better than their language production; in other words, they understand messages conveyed to them, but cannot produce messages of equal complexity. Educators can help students with Down syndrome communicate by providing appropriate motivation, keeping expectations high and letting students with Down syndrome realize that all communication is valuable. “Once this basic premise is in place, specific intervention and support can produce excellent results” (Downing, 1999).

ASSESSMENT AND PLANNING

Goals must be achievable, measurable and meaningful. Prior to setting goals, however, you must first develop an understanding of the student’s communication skills, including how successfully the student interacts in class, on the playground and in public. A teacher must first assess the communication skills by matching language and speech of the student to comprehension ability. Students with Down syndrome do not respond well to standardized tests, which fail to provide educators with practical information that can be used for intervention purposes (Downing, 1999).

General educators should observe a student’s responses to directions, commands, questions and social interactions. Educators should also document situations during which the student used specific forms of communication. In addition, the teacher can ask parents for examples of speech heard at home and instructions the student can understand, or ask the student’s aide to track speech and ability to follow instructions during the school day.

Consider the following questions in determining a student’s communication skills:

- ✓ What medium is the student using to communicate, i.e., oral speech, symbols, gestures, writing, etc?
- ✓ Does the student have opportunities to initiate communication with others?
- ✓ How do others respond to the student?
- ✓ Can the student maintain conversations with others?

TOTAL COMMUNICATION

“Total Communication” refers to the use of all means necessary to convey your meaning. This includes cuing, pacing, sign language, visual aids (written words) or augmentative communication devices to supplement speech. Most students will fade out the use of cues over time as they master sound and word production.

TOTAL COMMUNICATION METHOD	TOTAL COMMUNICATION METHOD CLASSROOM TIPS
Finger Cuing	• Finger Cuing is the term used when the teacher or therapist taps his or her own mouth when speaking. This alerts the student to watch the speaker’s mouth as he or she models the sounds or words. It is used primarily to evoke sounds or words. • Students will first use finger cues to talk and fade out the technique as they gain confidence to use speech spontaneously.

TOTAL COMMUNICATION METHOD	TOTAL COMMUNICATION METHOD CLASSROOM TIPS
Finger Pacing	- Finger Pacing refers to holding up one finger at a time to model the sequence of sounds, syllables or words. This alerts a student to articulate or slow down. It is used primarily to teach sound and word sequencing. - Through repetition, a student will memorize the correct sequences and gain confidence to use in conversation. - Students may use finger pacing to help them articulate multi-syllable words or long sentences.
Gestures	Some commonly understood gestures are waving, pointing or the “okay” symbol. A student can pair these gestures with speech to help ensure he is understood.
Sign Language	- Sign language builds receptive language and early communication in a visual way, and can be used as a transitional communication system until the child can communicate through speech. - Signs should be accompanied by the verbal word, so that when the student masters the oral words, the sign can be faded out.
Reading	- As discussed in the chapter on reading, students with Down syndrome are visual learners. - Reading positively impacts language development and is often a catalyst for increased intelligibility and sentence length. - Reading provides a visual cue to articulate, pace and use longer sentences. - Reading can improve word retrieval, auditory memory and sequencing (by providing repetition necessary to memorize and recall word order and the grammatical structures that will lengthen their sentences in speech), rate of speech and ability to follow instructions.
Music	- Music can be invaluable to speech production. Not only is it a powerful motivator for many students with Down syndrome, but it enhances a student’s ability to focus on auditory stimuli (which is normally a weakness). - The intonation, beat and rhythm of music provide cues for retrieval, sequencing and memory. - When students repeatedly sing the songs they enjoy, they are practicing and enhancing their receptive and expressive vocabulary! - For younger students, use music during opening and closing circles and during daily routines (“clean-up”). - Older students can use chants or cheers or practice songs for seasonal performances. - Several useful classroom strategies are the following: → Sing slowly, and enunciate or emphasize key words. → Pair words with actions or visual cues, e.g., pictures, stuffed animals. → Choose songs with meaningful vocabulary. → Encourage pacing by clapping or tapping to the beat. → Talk about the meaning of the song. → Use cues, e.g., mouth or omit key vocabulary words. → Use music creatively for transition times or to give instructions.

IN THE CLASSROOM

You can teach students with Down syndrome strategies to make communication less work and more fun. The goal of most parents is for their child with Down syndrome to be able to talk to and befriend classmates; ask for help; be a part of classroom discussions and activities; make presentations; and communicate needs, feelings and ideas.

The initial goal for your classroom should be to motivate the student with Down syndrome to talk spontaneously. This can be difficult at first, because they typically take longer to adjust to changes and learn routines. It is common for them to be reserved in group settings. If they do not feel confident about their speech, they may tend to “shut down.”

Focus on effort rather than results. Praise and positive reinforcements are powerful tools for students with Down syndrome. You can tell when a student is demonstrating effort if she does any combination of the following:

- ✓ Initiates and maintains eye contact
- ✓ Willingly faces the speaker
- ✓ Watches the speaker's face intently
- ✓ Imitates the speaker's words/phrases spontaneously
- ✓ Displays pride when praised by others, e.g., smiles, claps

Students with Down syndrome need more time, practice, consistency and reinforcement to learn communication skills. Group acceptance is a big motivator for all students. Teachers can facilitate this relationship for students with Down syndrome by fostering tolerance and understanding in the classroom, as well as refusing to allow teasing or mimicking.

Ensure that aides and assistants allow students with Down syndrome to converse with their classmates. Teachers can also provide public speaking opportunities, give the student "speaking" jobs, view the student with Down syndrome as capable and provide ample opportunity for buddy activities.

Positive and specific reinforcement is key, since praise is more powerful when it is a reminder of what a student has accomplished, e.g., "I like the way you ____" is more meaningful than "good talking." Remember to make communication activities fun!

GOAL	CLASSROOM TECHNIQUES AND STRATEGIES
Initiate and Maintain Eye Contact	• Model the behavior you want to see by getting down to the student's level and initiating eye contact. • Use prompts or cues, e.g., "Look at me," or "Chin up." • Use visual aids, e.g., hold the object of conversation up to your own face. • Wait for the student to cease other activity and give a visual cue, e.g., point to your eyes.
Attend to Speaker's Face and Respond to Visual or Auditory Cues	• Model the behavior you want to see, and teach the class a "listening position, "e.g., hands on lap, chin up; or "listening technique," e.g., "Stop, look, listen" paired with visual gestures. • Initiate eye contact with the student and wait for eye contact in return. • Use visual aids or strategies at transition times, e.g., flicker lights. • Make accommodations, e.g., consider seating the student near the speaker. • Repeat instructions.
Watch and Imitate the Actions and Words of Others	• Model the behavior you want to see. • Use classroom peer "Buddies," and remind students with Down syndrome to follow their Buddy's lead, i.e., "Look at your friend. What do you need to do?" • Reinforce spontaneous imitations with praise. • Use action songs and finger plays. • Encourage the student to ask you for clarification. • Repeat. • Use cues. When using visual aids, have the student self-check his work, e.g., "Did you cover all the steps?" When giving directions, prompt the student to repeat or paraphrase what you said.
Acknowledge Others and Initiate Greeting and Farewell Routines	• Model the behavior you want to see by establishing the words and routines you will use in your daily greeting routine, and use them consistently, e.g., shake hands or give a high five and say, "Hey! How are you today?" • Work with other school personnel to encourage a consistent appropriate greeting, i.e., if you teach your student to greet others by giving a high five, you don't want other staff to greet her by hugging. • Teach students the names of their classmates using various methods, e.g., photo books of classmates.

GOALS	CLASSROOM TECHNIQUES AND STRATEGIES
Take Turns During Conversation	- Model the behavior you want to see, and teach turn-taking behaviors in small groups, e.g. “My turn,” “Wait for your turn.” “Raise your hand.” - Use cues, i.e., call on the student to take turns. - Set and consistently enforce consequences for interrupting.
Increase Vocabulary in Order to Enhance Class Participation	- Review theme words and give parents a set to reinforce at home. - Use visual strategies, e.g. word banks, personal dictionaries, word webs. - Assign theme-related reading.
Recall Previously Learned Vocabulary When Cued	- Use prompts, i.e., “Tell/show me,” by sound/first part of word, or mouth the word with no sound. - Use visual cues or signs. - Use word associations, e.g., “It’s not night, it’s ____.” - Rhyme, e.g., “Sounds like cat.”
Speak Clearly and Intelligibly	- Remind the student to speak slowly or augment speech with signs or gestures. - Ask the student to repeat herself. - Model slow, clear speech. - Use pacing methods, e.g., finger or clapping.
Lengthen Sentences	- Use pacing methods, e.g., say and clap “I want to eat.” - Use cues, e.g., “Tell me more/in a sentence.” - Use prompts, e.g. “And then I _____.” - Practice and repeat. - Provide visual aids, e.g., sentence patterns.
Regulate the Volume of the Voice, and Speak Appropriately in Different Situations	- Model the behavior you want to see. - Teach concepts of quiet and loud, i.e., “inside” vs. “outside” voice, in a variety of different contexts, e.g., PE, recess, library. - Use cues or prompts, e.g., hold your finger to your mouth; say “Shhh...” “I can’t hear you,” or “Inside voice please.”
Speak Smoothly or Fluently	- Model the behavior you want to see by (1) allowing the student to finish speaking, and (2) maintaining attention and eye contact while he is speaking. - Encourage turn-taking and listening skills.
Express Emotions or Feelings	- Model the behavior you want to see by using “feeling” words, e.g., “You look sad. Tell me about it.” - Cue students to use words rather than expressing their feelings through actions. - Problem solve, e.g., “What upset you?” “What can you do next time?” - Use a visual aid such as a “feelings chart.”
Stay On Topic During Social Conversations	- Use cues, e.g., “Answer the question.” - Use redirections, i.e., “We’re on ____ now.” - Use visual cues to start conversations. - Practice and repeat a bank of social questions and appropriate social responses, e.g., “How are you doing today?” “What are you doing this weekend?” “What music do you like?”

SPEECH AND BEHAVIOR

Effective communication skills and socially appropriate behavior are interrelated. A student’s IEP goals must address behavioral expectations with regard to listening and attention because these are crucial to speech development. Students with Down syndrome can learn behavior skills when they are clearly taught and consistently enforced. It is important for educators and parents to work together on communication and behavioral concerns, as these will negatively impact a student’s learning or ability to interact socially with peers.

Sensory Processing

Sensory Processing

Sensory processing, also called sensory integration, refers to the normal neurological process of organizing and interpreting information from the environment (Wheble and Hong, 2006).

In our everyday lives, we obtain and process information through the senses, which include sight (vision), smell (olfactory), taste (gustatory), touch (tactile) and hearing (auditory), as well as movement (vestibular) and body position (proprioception).

The tactile, vestibular and proprioceptive senses are the lesser known of the senses; however, these senses are the most important for daily functioning. They can affect academics, attention, balance, bilateral coordination, body awareness, emotional and gravitational security, coordination, fine and gross motor skills, hand preference, self-comforting, self-esteem, social skills, speech and tactile discrimination.

Challenges in this area can lead to behavioral problems as well. Educators should be aware of Sensory Processing Disorder when examining and reacting to the classroom behavior of a student with Down syndrome.

THE TACTILE SYSTEM	THE VESTIBULAR SYSTEM	THE PROPRICEPTION SYSTEM
Protective Touch – The tactile system helps us to discriminate between threatening and nonthreatening touch sensations. Furthermore, the tactile system provides information about objects, e.g., texture, shape and size.	Coordination – The vestibular system helps us coordinate the movement of our eyes, head and body (Wheble and Hong, 2006). In addition, the vestibular system controls our body's relation to gravity.	Motor Skills – “The proprioception system consists of components of muscles, joints and tendons that provide us with a subconscious awareness of our body; for example, it enables us to sit properly in a chair and to step off a curb smoothly” (Wheble and Hong, 2006).
Characteristics of a Child with a Hypo- or Hyper-reactive Tactile System: • Withdraws from being touched • Dislikes certain textures • Prefers to wear loose clothing • Complains about or resists efforts at washing hair, brushing teeth or washing face • Often is unable to determine where something is touching their body (Rosinia, 2006)	Characteristics of a Child with a Hypo- or Hyper-reactive Vestibular System: • Displays spinning and rocking behavior • Frequently falls and trips • Exhibits poor eye control and concentration • Shows increased emotional sensitivity (Rosinia, 2006)	Characteristics of a Child with a Hypo- or Hyper-reactive Proprioception System: • Is often clumsy • May display hand flapping • May hold objects tightly or loosely • Hugs tightly • Walks very heavily • Seeks deep pressure by wearing heavy cloths or placing heavy objects upon the body

Characteristics of Sensory Processing Disorder (SPD)

Sensory Processing Disorder (SPD), also referred to as Sensory Integration Disorder or Dysfunction, occurs when an individual's brain inefficiently processes sensory messages from the environment. Individuals with SPD have difficulty responding to sensory experiences. A child may have a sensory input that is either unusually high or low. Children can fluctuate between the two extremes. Children with SPD usually display symptoms with frequency, i.e., several times per day; intensity, i.e., degree of reaction or avoidance; and duration, i.e., period of symptoms.

CHARACTERISTICS OF CHILDREN WITH SPD	
OVERLY SENSITIVE	UNDERSENSITIVE
Touch: • Child avoids contact with people and objects • Reacts negatively and emotionally to touch • Is picky about personal hygiene, particularly relating to clothes • Intentionally avoids certain textures and temperatures	Touch: • Child is unaware of being touched or bumped • May be unaware of messiness on face from food or runny nose
Movement: • Child avoids movement • May avoid activities that are not earthbound, e.g., running, climbing, swinging	Movement: • Child is in constant movement • Craves fast and spinning movements, e.g., child may flap arms
Body Position: • Child is insecure with body movement	Body Position: • Child is frequently clumsy • Displays a lack of coordination
Sights: Child lacks control of eye movement May have difficulty concentrating on objects May overreact to light.	Sights: • Child often misses important visual cues, e.g., facial expressions, gestures, signposts, written directions
Sounds: • Child prefers silence • Often complains about heavy noise.	Sounds: • Child has a poor attention span • Has poor auditory comprehension

SPD and the General Education Classroom

Children with SPD usually have difficulty in adapting to the general education classroom at first. However, there are several strategies a teacher can utilize to include a student with SPD in the general education classroom.

Assessment is crucial for managing sensory problems in the classroom. Standardized assessment can be used, but authentic assessment, which requires students to perform real-world tasks, is more effective. Teachers must first identify a real-world task and then identify or set the standards for correct performance of the task. Next, break down the task into subtasks. Once the teacher has identified criteria, a rubric can be created.

Example of Authentic Assessment for Sensory Processing:

SENSORY PROCESSING: PROPER HAND WASHING TECHNIQUE

Teacher's Name: _____

Student's Name: _____

CATEGORY	EXCELLENT	GOOD	POOR
Used Soap			
Rubbed Hands Together			
Duration of Rubbing Hands			
Water Use			
Paper Towel Use			

USUAL THERAPEUTIC INTERVENTION

- ✓ Identify child's sensory processing problems, e.g., registration, modulation, emotional and behavioral responses
- ✓ Develop a sensory processing team made up of relevant individuals, e.g., parents, caregivers, educational staff, school therapists
- ✓ Develop a sensory diet, i.e., a schedule of daily activities that promote sensory integration and provide useful feedback
- ✓ Use activities that calm or alert the system (see chart below)
- ✓ Utilize environmental modifications, e.g., light boxes, head phones, trampolines
- ✓ Frequently assess student's progress

MANAGING SENSORY PROBLEMS

It is beyond the scope of this manual to describe the whole management process for children with Sensory Processing Disorder. If you suspect that your student may have sensory processing difficulties, please consult the student's parents and your school's therapists.

GENERAL ACTIVITIES TO CALM & ALERT		
SENSORY SYSTEM	TO CALM	TO ALERT
Tactile	• Deep pressure touch • Swaddling • Rhythmic patting/stroking (massage) • Hugs (holding firmly) • Taking a bath	• Light touch (especially to face, palms and stomach) • Touch that involves movement • Taking a shower
Vestibular	• Rhythmic movement • Slow rocking • Maintaining head or body position • Sustained movement	• Non-rhythmic movement • Jiggle, bounce or jump • Upright positioning
Proprioceptive	• Resistive activities • Rhythmic motor activities	• Resistive activities • Changeable motor activities
Visual	• Muted, soft or natural colors • Room dividers • Steady, consistent input	• Bright colors and lights • Moving objects towards face • Focused lighting on objects • Moving objects at irregular speeds
Auditory	• White noises • Low-key humming • Monotone speaking or singing • Use of slow rhythms	• Vary intensity, pitch or beat • Loud music
Gustatory/Oral	• Sucking • Use of mild flavors • Consistent temperature and texture of food and liquids • Sustained blowing activities	• Citrus, salty or sour flavors • Cold liquids • Frozen treats • Variation in temperature and texture of food • Chew before or during focused tasks

Facilitating Friendships and Social Learning

Promoting Social Inclusion

TIPS FOR PROMOTING SOCIAL INCLUSION

To promote social inclusion, make sure the child with Down syndrome has learned how to behave appropriately in social situations. She needs to understand rules and routines and have the ability to cooperate with peers. In group work, she must be able to participate and respond appropriately, without dominating or becoming totally passive. She needs to learn how to share and take turns.

Outside, she needs to understand the rules of playground games and what is involved in being a team member.

IN THE CLASSROOM, SUCCESSFUL INCLUSION IS PROMOTED BY ENSURING THAT THE CHILD:

- ✓ Knows the major routines of the day (a visual timetable can help here)
- ✓ Has learned the class rules
- ✓ Can participate appropriately in a small group
- ✓ Will respond to requests and instructions from the class teacher
- ✓ Can tidy her work and line up appropriately
- ✓ Cares for others in the group and is aware of their feelings

Learning appropriate social and self-help skills is a high priority for most young children with Down syndrome. However, many will need extra help and support.

Key skills should be identified and then taught in small steps. Structured approaches such as backward chaining (the child is taught initially to do just the last part of the task, and then works backwards one step at a time) can be particularly useful.

Picture or photo prompt cards can be helpful, as they show the child what it looks like to complete the task. Similarly, peers can be used as role models to demonstrate successful task completion.

Before starting on a toilet training program, make sure the child is developmentally ready. Can she retain urine for at least an hour? Does she tell people when she is wet or soiled? If not, she may not be ready.

When teaching dressing skills, make sure the student is taught at the appropriate point in the day, e.g., coming in from play or changing for PE. Give her extra time so she doesn't feel rushed. If she is really slow, use a timer, and give smiley faces for finishing before the bell rings.

Encourage lunchtime staff to help the child eat independently, but not to cut everything up or feed her unnecessarily. If she takes a packed lunch, talk to her parents about making sure that it is easy to unwrap. If she needs extra time, let her go into lunch a bit early, but don't encourage her to push to the front of an existing queue.

Classroom Strategies

Social inclusion is a primary goal for most students with Down syndrome who are entering public school. In order to make progress in cognitive areas, it is crucial for them to interact with others in a socially acceptable way and to respond appropriately to their environment. Classmates can be role models for appropriate social behavior and are powerful motivators for learning.

Students with disabilities exhibit deficits in age-appropriate social skills (Mastropieri & Scruggs, 2002). Children of elementary-school-age who have developmental delays find it difficult to establish and maintain reciprocal friendships, e.g., many play alone rather than engage in group play. They are also less likely to initiate interactions with other children. However, research findings show that students can develop real friendships with early intervention. Developing social skills at a young age is critical. As students get older, the opportunities to form friendships with typically-developing classmates diminish.

Friendships benefit both “typically-developing” students and students with Down syndrome (Falvey, 2005). Students with Down syndrome avoid loneliness; gain support in developing social, communicative and cognitive skills; increase self-esteem with a sense of belonging and develop a support network within their school communities. Typically-developing students “seem to have more positive attitudes and a better understanding of the challenges that peers with disabilities face” (DeutschSmith, 2006).

Keep in mind that too much one-on-one support from an aide or teacher can impair the student’s ability to benefit from peer group models, learn to work cooperatively and develop social relationships with classmates.

ASSESSING SOCIAL SKILLS

Social skills are a collection of behaviors in an individual’s repertoire that enable him or her to interact successfully in the environment (Mastropieri & Scruggs, 2002). It is important to assess the social skills of all students in the classroom.

The following assessment procedures are good methods to assess students’ social skills:

- ✓ Sociometric Measures
- ✓ Teacher Ratings
- ✓ Roleplay Tests
- ✓ Naturalistic or Direct Observation

Sociometric measures assess the degree of social acceptance among students. Peer nomination, e.g., polling students to determine who they like the most or least, can help educators identify students who are not being socially accepted in the classroom. Teacher ratings provide information about strengths and weaknesses in social skills, e.g., a daily checklist of “how well” or “how frequently” a student displays appropriate social skills (Mastropieri & Scruggs, 2002). Role-playing can be used to assess a student’s ability to perform specific social skills. Naturalistic or direct observations are performed in the students’ natural settings to determine which social skills are appropriate for a specific student.

SOCIAL SKILLS INSTRUCTION

It is important to note that students with Down syndrome must be directly taught socially-appropriate behaviors, e.g., no hugging, turn-taking, sharing, classroom rules. Social skills instruction should start at an early age and be geared toward teaching students with Down syndrome how to participate appropriately in major routines of the day, e.g., circle time, lining up.

SOCIAL SKILLS INSTRUCTION	
Daily Review	- Practice learned social skills at the start of each new lesson, e.g., if the previous lesson emphasized eye contact, the next lesson begins with a review of appropriate eye contact (Mastropieri & Scruggs, 2002). - Daily review is valuable because it provides educators with opportunities to assess students' retention.
Presentation of Material	- Clearly outline goals and objectives. - Provide students with a step-by-step overview of the lesson. - Use varied examples in different contexts.
Guided Practice	- Model, demonstrate and question students first, and then allow time to practice exercises. - Guide students through the exercise, and provide immediate corrective feedback when appropriate. - Group activities are perfect to utilize when developing guided practice activities for social skills.
Independent Practice	Create worksheets displaying scenarios with appropriate and inappropriate behavior. Students would be required to circle/match the scenario with the behavior.
Weekly/Monthly Review	- Provide weekly and monthly reviews of previously taught social skills. - As inappropriate and appropriate social behaviors occur throughout the day, emphasize and reinforce previously learned social skills (Mastropieri & Scruggs, 2002).
Formative Evaluation	- At the end of the lesson, assess students' mastery of the social skills learned. - This can be conducted as a class activity.

Strategies for Facilitating Friendships

The following techniques are strategies that facilitate student friendships and social networks:

FOSTERING INTERDEPENDENCE

Traditionally, the curriculum for students with Down syndrome has focused on direct or independent teaching. However, interdependence is essential for students with disabilities. "Interdependence is when two or more people learn and agree to function as a group, relying on each other to get through the day and accomplish what is necessary and desired by the group" (Falvey, 2005). Designing curriculum to include interdependence teaches students responsibility and trust.

Classroom Strategies:

- ✓ Arrange seats in clusters, and give each member a daily assignment that is necessary for the group to accomplish its daily task(s).
- ✓ For example, one student must sharpen all the pencils, and another student must collect and turn in all the homework assignments, of students in the cluster.

ALTERNATIVE AND AUGMENTATIVE COMMUNICATION

Students must be able to communicate with their classmates and must have opportunities to make choices and decisions. Students with Down syndrome often cannot communicate effectively because of a speech or language impairment. Augmentative communication devices allow students to use an alternative source to spoken language.

Classroom Strategies:

- ✓ Create communication boards with photos.
- ✓ Utilize technology.
- ✓ Work with the speech therapist and IEP team to determine whether a student needs an augmentative communication device.

SOCIAL STORIES

“Social Stories are short, explicit descriptions of appropriate social behaviors in the form of a story” (Falvey, 2005). Social stories are a great strategy for teaching students social skills, because social stories place the social skill in a real scenario to which the student can relate.

Classroom Strategies:

- ✓ Incorporate social stories into the class day, e.g., students can read them independently or on audiotape, teachers can read aloud.
- ✓ For social stories to be effective the stories must be individualized and meaningful, i.e., they should incorporate the specific needs of the student for whom the story is written.
- ✓ Use social stories to teach social skills such as how to ask for help or deal with emotions.

PEER COLLABORATIONS

Another effective strategy for facilitating friendships and social networks is peer collaborations. Peer collaborations utilize students as instructors, advocates and decision makers in the classroom (Falvey, 2005). For this strategy to work, educators are required to provide students with active planning, support and facilitation. The results of successful peer collaborations can be both social and academic.

Classroom Strategies:

- ✓ Use peer tutors. In comparison to adults, peer tutors use more age-appropriate vocabulary and examples, are more directive and are more familiar with potential frustrations.
- ✓ Have peers assist students with Down syndrome in making transitions between activities or classrooms.
- ✓ Peer collaborations build friendships and caring classrooms.
- ✓ The more opportunities students with disabilities have to interact and socialize with other students, the greater the possibility for friendships to occur.
- ✓ Remember that the goal of peer collaborations is for students to develop their own social networks. This is accomplished by providing students with numerous opportunities to work together teaching and making decisions.
- ✓ Help students see that individuals with disabilities have similar strengths and interests.
- ✓ Facilitate student communication outside the classroom in other school settings.
- ✓ Encourage students to join extracurricular activities. This not only fosters social networks, but provides students with ample opportunities to practice social skills in different settings.

COOPERATIVE LEARNING GROUPS

In this strategy, “students work in small mixed-ability groups for reading and content subjects, and they help each other learn and understand information” (DeutschSmith, 2006). Students engaged in cooperative learning demonstrate higher levels of reasoning, generate new ideas and solutions and transfer learned skills appropriately to different situations (Falvey, 2005). In addition, cooperative learning enhances the “social and emotional well-being of the student by promoting positive interpersonal relationships.”

Classroom Strategies:

- ✓ Rewards can be given based on a team’s results.
- ✓ Be sure to make tasks manageable for students with Down syndrome, and be aware of the potential positive and negative outcomes of group dynamics. If a group “fails” because of a student with Down syndrome, his classmates could become resentful.

CIRCLES OF FRIENDS

Circles of Friends is an exercise designed to bring peers together by creating a network of support and friendship for a particular student (Falvey, 2005). Students are asked to consider their own circle of friends and family, and then reflect on the circles of other students in the class.

Circles serve as a visual representation of people in students' lives and can be useful in identifying voids in their social networks. Circles can teach students about the value of relationships and the impact that people can have in their lives.

The picture of the student's life is represented by four concentric circles, with the student placed in the center circle. In the surrounding circles, she is asked to place people according to the nature and closeness of their relationship with her.

The circles are arranged starting with the inner circle and moving out, ending with the outermost circle.

Each circle has a different meaning: (1) circle of intimacy, (2) circle of friendship, (3) circle of participation and (4) circle of exchange (Falvey, 2005).

Circle of Intimacy	The students are asked to place themselves into the circle of intimacy. In the circle, the students are instructed to write the names of family and friends who are the closest to the student, e.g., mother, father, brother, sister, grandparent.
Circle of Friendship	In the second circle, students are instructed to write the names of best friends and people that they spend a lot of time with and/or care about, e.g., neighbors, aunt, family friend, cousins.
Circle of Participation	In the third circle, students are instructed to write the names of people they see frequently as a result of participation in school, organizations, clubs or other activities, e.g., teammates, classmates.
Circle of Exchange	In the fourth circle, students are instructed to write the names of people who are paid to provide a service for the student, e.g., teachers, therapists, counselors, social workers.

Classroom Strategies:

- ✓ Use circles to identify voids in a student's social network.
- ✓ Fill voids by creating a "circle of support" around the student.
- ✓ Once a circle of support is created, the group should meet on a regular basis to identify ways to spend time with the student and introduce her to new people.
- ✓ Remember that bringing people together to form friendships takes time, commitment and effort.
- ✓ Provide support and encourage attendance at lunchtime or afterschool clubs.

Buddy Programs

Friendships play an important role in achieving success in school, the workplace and the community. Since many students easily make friends, it is easy to overlook this important aspect of development for children with Down syndrome.

There are many reasons to start a Best Buddies or similar Buddy program at your school:

- ✓ **Loneliness and Isolation** – Children with disabilities can frequently experience isolation and loneliness.
- ✓ **Benefits for Typically-Developing Students** – Research shows that interaction with children who have disabilities has a positive impact on typically-developing students.
- ✓ **Social Skills are Essential to Holding a Job** – To be hired for and be successful at a job, individuals must be able to interact effectively with other people, as well as perform job tasks. Social and interpersonal skills are crucial to workplace success.
- ✓ **Fostering Appreciation of Diversity** – By pairing "typically-developing" students with others who have disabilities, Buddy programs can meet immediate needs and have long-term effects by changing peoples' attitudes toward individuals with disabilities.

"Best Buddies High Schools" pairs people with intellectual disabilities in one-to-one friendships with high school students. By introducing Best Buddies into high schools, Best Buddies "crosses the invisible line that too often separates those with disabilities from those without."

Each chapter is a registered student organization within the school and is led by a chapter president who organizes, leads and maintains a chartered chapter of Best Buddies for the duration of one academic year. There are currently no Best Buddy chapters in the State of Michigan.

To learn more about Best Buddies or to start a chapter, go to www.bestbuddies.org.

e-Buddies®

e-Buddies® is an e-mail pen pal program for people ages ten and older who have intellectual disabilities and peer volunteers from across the United States and around the globe. e-Buddies® is a fun and safe way to make a new friend in a secure online setting and is available to anyone who has an e-mail address. e-Buddies® can also be a great teaching tool for a special education classroom. It can help teach social skills, as well as literacy and computer skills. Joining e-Buddies® is quick and easy. Visit www.ebuddies.org to read more and to complete the online application.

Extracurricular Activities

There are several adaptations which can be made to assist students with Down syndrome with participating in extracurricular activities such as team sports.

STRATEGIES

- ✓ Explain the rules of the game in clear, understandable language.
- ✓ Teach turn-taking.
- ✓ Partner students with Down syndrome and typically-developing Buddies in working toward an objective, or have Buddies assist students with Down syndrome with transitioning from prior classes or activities.
- ✓ Use visual cues, e.g., gestures, markings on floor.
- ✓ Be aware of noise levels and gravitational insecurities.
- ✓ Plan teams for students of all abilities!

Special Olympics

The mission of Special Olympics is to provide year-round sports training and athletic competition in a variety of Olympic-type sports for all children and adults with intellectual disabilities. Athletes are given continuing opportunities to develop physical fitness and athletic skill; demonstrate courage; experience joy; and participate in a sharing of gifts, skills and friendship with their families, other Special Olympics athletes and the community. Events are year-round in area, regional and state levels. Event divisions are based on age, gender and ability level to give athletes an equal chance to win. Each participant receives a medal or ribbon following his or her event.

Special Olympics training and competition is open to every person age eight or older who has an intellectual disability. There is no maximum age limitation for participation in Special Olympics. Children who are at least six years old may participate in age-appropriate Special Olympics training programs offered by SOMI or in specific (and age-appropriate) cultural or social activities offered during the course of a Special Olympics event.

Find information on your SOMI area chapter at 1-800-644-6404 or www.somi.org.

VIP Soccer

The AYSO Very Important Players (VIP) Program provides a quality soccer experience for children and adults whose physical or mental disabilities make it difficult to successfully participate in mainstream teams. The VIP Program is structured to integrate players into the rest of AYSO by providing a soccer season, and in some cases using "buddies" – able-bodied helpers - to assist players both on and off the field. The goals for every participating player are to have fun playing soccer, understand the fundamentals of the game, learn teamwork and fair play, increase positive self-esteem, become more physically fit and meet and be comfortable with new people.

The Kentwood AYSO (Area 767) currently offers a VIP program. Call 1-616-531-2552 for current and upcoming schedules.

Find a VIP Program in your area at www.ayso.org/special_programs/vip.aspx

Challenger Little League

The Challenger Division was established in 1989 as a separate division of Little League Baseball in order to enable boys and girls with physical and mental challenges, ages five through eighteen years or the completion of high school, to enjoy the game of baseball along with the millions of other children who participate in this sport worldwide.

Teams are set up according to abilities, rather than age, and can include as many as fifteen to twenty players. Players can participate in one of three levels: Tee-Ball, Coach-Pitch or Player Pitch. The use of "buddies" is encouraged for the Challenger players. Buddies assist the Challenger players on the field, but whenever possible encourage the players to bat and make plays themselves.

The Grandville Little League currently offers the Challenger program. Call 1-616-813-8466 or go to <http://www.eteamz.com/grandvillell/> for further information.

Find a Challenger Program in your area at:

[www.littleleague.org/Learn More/About Our Organization/divisions/challenger.htm](http://www.littleleague.org/Learn%20More/About%20Our%20Organization/divisions/challenger.htm)

Positive Behavior Supports

In terms of behavior and personality, individuals with Down syndrome vary just as widely as their peers. Most are sociable and well-behaved.

Students with additional needs in the area of behavior rarely fall outside the range of behavior exhibited by their peers, and the school's behavior guidelines will be applicable to all students. If a student with Down syndrome routinely engages in difficult behavior, it is important to examine the underlying reasons, because often some aspect of school life does not meet her needs. Research-based knowledge regarding the ranges and types of behavior difficulties exhibited by students with Down syndrome can be informative, particularly if paired with proven behavior intervention plans. This includes using information from assessments, partnerships with parents, quality of relationships with these students, achievement in the curriculum and differentiated instruction. Research has shown that "inappropriate" behavior can serve an important function for an individual with a disability. Behavior, whether or not it is socially acceptable, frequently serves to communicate wants, needs or preferences. This is especially true for individuals who may not have an effective system of verbal communication.

BRIEF INSIGHT INTO BETTER CLASSROOM BEHAVIOR

In a 1996 NDSS Study, parents and educators provided tips on managing classroom behavior. Generally, the most effective technique for behavior management is praise. The following methods are sometimes effective for behavior management in students with Down syndrome:

- ✓ Material Rewards
- ✓ Time-outs
- ✓ Peer Pressure
- ✓ Loss of Privileges
- ✓ Contact with Parents

The following methods are generally NOT effective for behavior management in students with Down syndrome:

- ✓ Ignoring the Behavior
- ✓ Reprimands
- ✓ Punishment

Causes of Inappropriate Behavior

The most common form of inappropriate behavior in all children, including those with Down syndrome, is behavior designed to gain attention. Children with Down syndrome may be particularly attention-seeking because:

- ✓ They enjoy being the center of attention and dislike being ignored.
- ✓ They are used to having adults by their sides all the time and resent the adults working with other children.
- ✓ They are used to getting special treatment and object if it is withdrawn.
- ✓ They have been successful in using attention-seeking behavior in the past to get their own way or avoid work.

Sometimes children with Down syndrome will misbehave because they are angry or frustrated.

- ✓ They may try to do the same tasks or activities as others, but find they can't cope without help.
- ✓ They may presume that the work they are being given is too difficult or uninteresting.
- ✓ They may get annoyed when other people don't take the time to understand what they are trying to say.

Sometimes children with Down syndrome may appear to misbehave when they are, in reality, just confused or uncertain about what they are supposed to do.

- ✓ They may have failed to understand instructions given to the whole class.
- ✓ They may have forgotten what they have been told.
- ✓ They may be finding it hard to learn new rules and routines and still do things in the old way.
- ✓ They may be confused by different adults giving conflicting messages.

Children with Down syndrome are often subjected to a high level of structure and supervision. As a result, they may feel the need to exert some control over their lives.

- ✓ They may refuse to cooperate with their teachers or assistant as a matter of principle.
- ✓ They may be obstinate if they feel they are given no opportunities to choose their own activities.
- ✓ They may feel under pressure and need a break.
- ✓ They may resent being regularly withdrawn from class and separated from their friends.

Finally, immaturity may lead to behaviors more appropriate of younger children.

- ✓ They may not have the concentration or memory skills of their peers.
- ✓ They may have immature play and social skills.
- ✓ Immature behavior may have been ignored or reinforced in the past.
- ✓ They may have been over supported and had little opportunity to mix freely with their peers.

Options for Behavior Management

The management of behavior in students follows the progression from "external locus of control" to "internal locus of control." These are fancy phrases to describe the process of moving from adults being responsible for controlling behavior (in young students), to students becoming more and more responsible for controlling their own behavior. It is a progression through which all individuals go. Thus, when a child or student is not behaving, ask yourself, "Where is the location of control? Is it in the person or in the external source?" The goal of behavior management must be to transition from external to internal control. This is a learned activity; therefore, it can be taught.

THE BEST FORM OF BEHAVIOR MANAGEMENT IS PREVENTION.

Adults who work with children begin to know very early on when trouble is brewing. That adult has the following three options available to nip the behavior in the bud:

1. Modify the child.
2. Modify the environment.
3. Modify the interaction.

Each of these three options has strengths when it comes to behavior management, but one of the main strengths is that prevention keeps the behavior from ever becoming a problem.

SUPPOSE YOU MESSED UP ON PREVENTING A BEHAVIOR FROM ESCALATING, WHAT THEN?

The second best method of behavior management is redirection. Redirection is accomplished by simply walking over to the child and directing him to another activity. This can be done with a hug, a smile and a reassurance that there is something better to do. No words are used. It is not necessary to get into a great explanation about what is not acceptable to you — just physically redirect the child to a better place. Redirection requires warmth and genuineness, so it is probable that you need to be known to the child. Never underestimate the power of a hug.

MOVING ON FROM PREVENTION AND NONVERBAL REDIRECTION, THE NEXT BEHAVIOR MANAGEMENT TECHNIQUE IN THE LIST OF OPTIONS IS TO SAY “NO,” OR BETTER, “NOT” AND GIVE THE CHILD SOME WAY TO FIND A BETTER ACTIVITY

This involves the first use of speech and language with the child. However, it does not mean you stand across the room or sit on the couch and shout “NO!” It means you go over to the child, get on her level (bend down, squat down or sit on the same level) and get her attention in a very quiet way. Make sure she is looking at you, and then tell her, “No, we don’t do that; let’s do this...” You may offer the child an option, not a series of options or undirected choices, of doing something else. When a child is offered a choice, it needs to be from no more than two options. Let the child be in control and choose from the two options. It is wise on the adult’s part to stack the deck by offering choices that are known to be favorites. Play to win.

THE SOURCE OF PERSONAL POWER IS THE FEELING THAT YOU HAVE A CHOICE

Often when a child is not doing what is requested or expected, it is because he does not feel empowered to participate in what is happening. Acting out or defying is an illustrated example of a person who feels powerless. You must be smarter than the problem. Take the child to a safe place where there are no distractions, and talk to him in a low voice about making good choices. The key to this, for most children, is to ask if the exhibited behavior “makes a friend.” Every person wants friends. Powerless people do not feel that they have friends; therefore, use the moment as a teachable moment to talk about making friends. “What would make a friend? Would it be sharing, would it be waiting your turn, would it be respecting the other person?” Find out what the child thinks makes a friend of another.

IT IS A RULE OF HUMAN BEHAVIOR THAT BEING AWARE OF THE BEHAVIOR CHANGES THE BEHAVIOR

This is called “reactivity,” meaning that when a student is asked to keep a record of good behavior, that behavior increases. Keeping a written record, therefore, is a very powerful management approach. Remember that “behavior that is rewarded will be repeated.” Reactivity rewards the behavior that you want. You may start (external locus of control) by keeping a chart of good behavior taped to the student’s desk and periodically going by and noting good behavior. This may also be reinforced with verbal praise like, “I really like it when you stay in your seat, listen to the lecturer, pay attention to directions, etc,” paired with a mark on the chart. Then gradually fade out the marking, and get the student to practice reactivity.

USE CHARTS TO STAY ON TASK

It is possible to use the top of a desk to apply a chart that gives the schedule for the day or hour or however long the teacher selects (shorter is better). Pointing to the task or moving a marker along the chart to keep on task is another way to enhance internal control of behavior.

SELF-REWARD IS THE MOST POWERFUL BEHAVIOR MANAGEMENT APPROACH WE HAVE

Having the student say “Good boy,” when complying with a request is another way to increase the internal locus of control. Counting the “Good boy” comments, again, gives positive reward for behaviors. Find out what he likes, wants and desires, and have him choose his own reward for compliance. Remember, rewards move along a continuum of tangible, to intangible, to self-reward. That the student knows the rule and gives the rule to himself is the ultimate behavior management goal.
